

**Replacement for the paragraph beginning at page 11, line 14 to line 24:**

A4 FIG. 4C shows a superimposed scroll display mode in which when a panoramic image 80 is scrolled and displayed in a normal size, a superimposed display 90 is performed in the display area 70 to indicate which portion of the image 80 is currently displayed therein. In this mode, the superimposed display 90 allows a user to confirm which portion of the panoramic image is currently displayed (e.g., which image is displayed), at first sight. Consequently, the user need not perform any unnecessary operation and the apparatus is improved in operability.

**CLAIMS (with indication of amended or new):**

**AMENDED**

- A5 1. An image reproduction apparatus comprising:  
display-image discrimination means for discriminating a display mode in which selected image data is to be displayed, the display mode including at least a normal display mode, an at-a-glance display mode and a panoramic display mode;  
display-mode setting means for setting the display mode, which is discriminated by the display-image discrimination means, to the image data; and  
display means for displaying the image data in the display mode set by the display-mode setting means.

**AMENDED**

- A6 9. An image reproduction apparatus according to claim 1, wherein the display means includes means for performing a superimposed display to show which portion of a panoramic image is currently displayed in a display area when the panoramic image is scrolled in a normal size.
